Tourism Promotion Web Page project

Overview
In this project, you will design and implement a React-based web page aimed at promoting tourism in your hometown or any city of your choice. The objective is to create an engaging, interactive, and visually appealing platform that showcases the most attractive aspects of the selected location.

Project Requirements
Your web page must include all the following elements:

1. Multimedia Integration
To enhance user engagement, your website must incorporate:
- *At least one video or 3D animation*
  This can be a promotional video, a street tour, or a simple 3D animation created by you.
- *One edited image*
  The image should show evidence of editing (color correction, compositing, filters, text overlay, etc.).
- *An audio clip of at least 30 seconds*
  This can be background music, ambient city sounds, a narrated guide, a local tale, or any audio relevant to the tourism theme.

2. User Interaction
Your website must include a section where visitors can see different tourist activities offered in the city and let them select the ones they want to do. Create an element similar to a cart, where the users can see their choices.

Technical Requirements

- The web page must be built using React. You can use the Create React App template to start the project.
- Multimedia files must be properly optimized and embedded. Create a folder structure to store the multimedia files.
- The final project must be structured clearly, with reusable components and good coding practices.

Deliverables

- Source code of the entire project (GitHub link recommended).
- A short technical report (1–2 pages) that includes:
  - A short description of the page structure (wireframe)
  - A description of the implemented features and multimedia elements.
  - A brief explanation of the development process.
  - Instructions to local run the website
